Subject: Brooks McCall Data assessment
Date: 05/22/2010 09:01 AM

I met with NOAA, BP, and USCG representatives this morning to review the data from 5/21/10 and we made the following assessment:

- 1) CTD data indicate that the subsurface plume may have shifted to the west. Depth and relative source strength is consistent with previous findings.
- 2) Neither the DO or rototox toxicity data are approaching shut off criteria.
- 3) Nothing in the current data suggest that any changes should be made to the current dispersant injection operations.
- 4) This data will be fed into NOAA subsurface models to assist in targeting future sampling activities.
- 5) The Brooks McCall is in port today for resupply and data cable modifications, so no sampling will occur today
